                                                                                                                                                                                                                                                The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (I). (I) is useful for detecting PRO4993, PRO337, PRO1559, PRO725, PRO7020 or PRO793 polypeptide, and for PRO4993, PRO337, PRO1559, PRO725, PRO7020 or PRO793 polypeptides. The bloactive molecule to a cell expressing the above polypeptides. The bloactive molecule is a toxin, radiolabel or an antibody and causes cell death. (I) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral neuropathy, diabetic peripheral neuropathy, AIDS-associated neuropathy, Charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia, Tangier disease, Krabbe's disease, Metachromatic leukodystrophy, Fabry's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Example 114; Page 190; 459pp; English.

```
The invention discloses a hairpin sensor comprising a hairpin loop cassembly including a complementary probe positioned between a first cliuverse repeat arm and a second inverse repeat arm, and a quenchable converse repeat arm and a second inverse repeat arm, and a quenchable converse repeat arm of the hairpin loop assembly opposite the complementary probe. Also claimed is a microarray comprising the hairpin complementary probe is bound, directly or indirectly, to a support, a kit for detecting a target nucleotide sequence in a sample comprising the complementary probe is bound, directly or indirectly, to a support, a kit for detecting a target nucleotide sequence in a sample comprising the complementary probe, or semi-conductive, including at least one of the particle is conductive or semi-conductive, including at least one of the cabove hairpin sensor assemblies. The hairpin sensor further comprises a composite the complementary probe, or first space opposite the first the first inverse repeat arm composite the functional group selected from amino, carboxyl, thiol and hydroxyl, further, the sensor comprises a ligand positioned between the second inverse repeat arm and the quenchable fluorescing agent which comprises a semiconductor nanocrystal or rhodamine B-labelled dye. Within the sensor include complementary composes that are the same or different and respective quenchable configures and the sensors into the same or different and respective quenchable configures arranged in a sampin sensor interest. The two or more hairpin sensors into the sensor different. The two or more hairpin leaders are the same or different. The two or more configures that are the same or different. The two or more marranged in a starting ly-defined nattern. The sensor interest marranged in a starting ly-defined nattern.

                                                                                                                                                                                                                                        hairpin sensors are arranged in a spatially-defined pattern. The sensor and system are useful for detecting a target nucleotide sequence in a sample. Further, the method involves identifying the target nucleotide sequence by the location of the complementary probe to which the target nucleotide sequence binds. The two or more hairpin sensors include complementary probes or quenchable fluorescing agents, that are different. The sequence presented is the hairpin oligonucleotide target sequence, #2, used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Hairpin sensor useful for detecting a target nucleotide sequence in a sample, comprises a hairpin loop assembly including a complementary probe and a quenchable fluorescing agent.
                                                                                                                                                                  Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ballinger CT,

In particular, the invention crelates to the differentiation of murine embryonic stem cells. The method control of into functioning cells. Other methods are useful for treating a mammalian embryonic stem cells. The method cells into functioning cells. Other methods are useful for treating a mammalian cells are pancreatic islet like cell clusters and in nerve function. CC functioning cells induced from embryonic stem cells using the present cells are pancreatic islet like cell clusters and nerve function. CC functioning cells induced from embryonic stem cells using the present cells of the cells are useful not only for cell transplant therapy, but for in vitro cells are useful not only for cell transplant therapy, but for in vitro cells are useful not only for cell transplant therapy, but for in vitro cells are useful not only for cell transplant therapy, but for in vitro cells are useful not only for cell transplant therapy, but for in vitro cells are useful not only for cell transplant therapy. But for in vitro cells are useful not only for cell transplant therapy bettor nerve cell cunction, and for safety evaluation of new drugs. The present sequence is a PCR primer used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           S

Detecting nucleic acids having at least 2 portions comprises use of nanoparticles which have oligonucleotides attached to them that are complementary to portions of the target nucleic acid sequence.

Example 18; Page 44; 130pp; English.

CC portions comprises providing a type of nanoparticles (NP. e.g. colloidal CC gold) having oligonucleotides (O) attached (where (O) on each NP has a CC sequence complementary to sequence of at least two portions of NA), and observing a detectable change brought about by CC contacting NA and NP to allow hybridisation of (O) on NP with 2 or more CC portions of NA, and observing a detectable change brought about by CC core probes, substrate having (A) attached to it, a metallic or cC comprising nanoparticles and stellite probes. The methods of nanofabrication utilising comprising nanoparticles and methods of nanofabrication utilising compositions and stellite probes. The methods, probes mucleic acids, and cC nanoparticles and oligonucleotides are useful for separating a selected cC nucleic acid having at least two portions, from other nucleic acids, and cf or detecting nucleic acids having at least two portions, from other nucleic acids, and cf or detecting nucleic acids having at least two portions, from other nucleic acids, and cf or detecting nucleic acids having at least two portions, from other nucleic acids, and cf or detecting any type of nucleic acids which may be used for diagnosis of disease and in sequencing of mucleic acids. Perferably, the method is useful for tetecting any type of nucleic acids. Perferably, the method is useful for cytomegalovirus and Epstein-Barr virus, hepatitis virus, herpes virus, cytomegalovirus and Epstein-Barr virus, bacterial diseases, sexually crommitted diseases, inherited disorders, in forensics, in DNA committed disorders, in forensics, in DNA committed disorders, in forensics, in DNA committed and the committed detect the committed date acids based on observing a colour change with the naked eye is cheap, fast, simple and construction.

CC presence is a spacer oligonucleotide used to illustrate the method of the invention.

Sequence 20 BP; 20 A; 0 C; 0 G; 0 T; 0 U; 0 Other;

             This invention relates to a novel method for detecting nucleic acids. The method comprises providing nanoparticles with oligonucleotides attached to them, which have a sequence complementary to a sequence of two portions of nucleic acid, contacting the nucleic acid and nanoparticles to allow hybridisation of the oligonucleotides with two or more portions of the nucleic acid, and observing a detectable change brought about by the hybridisation. The nucleic acid to be detectable change brought about by the hybridisation. The nucleic acid to be detectable sequence a control of the distances between these are chosen so that when the control of the hybridisation. The method of the invention is useful for a detectable change occurs. The method of the invention is useful for contectable change occurs. The method of the invention is useful for contectable control of the invention is useful for consparticle acids (from a biological source) having at least two portions, such as viral RNA, bacterial or fungal DNA, a gene casciated with a disease, synthetic, or structurally modified natural cor synthetic RNA or DNA, or a product of a polymerase chain reaction cor amplification. Nanoparticle-oligonucleotide conjugates of the invention are useful for preparing a nanoparticle acid bound to an electrode surface.

CC Nanoparticles and nanoparticle conjugates of the invention are useful for nanofabrication and for separating a selected nucleic acid having two corritons from other nucleic acids. Diagnostic assays employing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 29-JUL-1996;

                                                                                                             The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic action an aerosol formulation. The method and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represent an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nucleic acid detection methods and can be used to detect nucleic acids that are present in only small amounts in a sample. The present sequent represents a thiol modified oligonucleotide sequence used to demonstrathe method of the invention

                                                                                                                                                                                                                                ADB36601;
                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represent an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ds; allergy; asthma; poly-G nucleic acid; aerosol formulation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represent an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                 Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ds; allergy; asthma; poly-G nucleic acid; aerosol formulation;
hypo-responsive subject; immunostimulatory.

important for bone maintenance and plays a protective role in the cardiovascular system, as well as being required for normal sexual maturation through promoting growth and differentiation. Splice variants of ESR-alpha, however, have been associated with various cancers including the breast and pituitary. Accordingly, antisense oligonucleotides that inhibit the expression of ESR-alpha in cells or tissues can be used in gene therapy to treat conditions such as hyperproliferative disease, inflammation, tumour formation and to prevent or delay infection. As such, the present invention describes these
                                                                                                                              This invention relates to human oestrogen receptor alpha (ESR-alpha), as the novel antisense oligonucleotides that modulate its expression. The cestrogen receptor alpha protein is also known as cestrogen receptor 1, ESR1, and NR3A1. Oestrogen, the steroid hormone ligand of ESR-alpha, is
                                                                                                                                                                                                                                              New antisense compound targeted to nucleic acid encoding estrogen receptor alpha and inhibiting expression of estrogen receptor alpha, useful for treating a disease or condition e.g. a hyperproliferative

                                                                                                                         The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking bioactive molecules to cells expressing PRO polypeptides, and for identifying agonists or antagonists. The bioactive molecule maybe a toxin, radiolabel or antibody, and cause cell death. The PRO polypeptides are useful for treating neuropathy and neuropathy related diseases such as Charcot-Marie-Tooth disorder, Refsum's disease, and Krabbe's disease. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for
                                                                                                                                                                                                                                                                                                                                                                                                 New PRO polypeptides useful for treating peripheral neuropathy, neuropathies associated with systemic disease such as post-polio syndrome or AIDS-associated syndrome.
                                                                                                                                                                                                                                                                                                                                                                  Disclosure; SEQ ID NO 577; 425pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (GETH

Novel secreted and transmembrane polypeptides and polynucleotides encoding them, useful for treating wound healing, tissue growth and muscle generation and regeneration, amyotrophic lateral sclerosis o õ

Example 114; SEQ ID ð 577; 472pp; English.

CC polypeptide (1). PRO polypeptide such as PRO213, PRO770, PRO320 or PRO615 CC is useful in biotechnological and medical research, as well as in various CC industrial applications. PRO polypeptide such as PRO300, PRO3030, PRO310, PRO311, PRO3121, PRO311, PRO615, PRO618, PRO7703, CC PRO780, PRO321, PRO3121, PRO5131, PRO615, PRO618, PRO772, PRO853, CC PRO860 or PRO846 is useful for therapeutic purposes. PRO363 is useful CC therapeutically in vivo for lessening the effects of viral infection. CC PRO200 is useful for the treatment of wound healing, tissue growth and CC amyotrophic lateral sclerosis, neuropathy, AlbS-associated neuropathy or CC diabetic peripheral neuropathy. A polynucleotide [II] encoding [I] is CC useful for generating transgenic animals or knockout animals which are CC useful in the development and screening of therapeutically useful CC reagents, as probes for generating a pool of sequences for identifying CC related PRO coding sequences, and to construct hybridisation probes for CC individuals with genetic disorders, for recombinantly expressing [I] and CC useful for screening compounds to identify those that mimic the PRO cCC useful for screening compounds to identify those that mimic the PRO polypeptide (agonists) or prevent the effect of the PRO polypeptide (asonists) or prevent the effect of the PRO polypeptide (asonists) are useful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful in diagnostic assay of sample content and proper seconds and cell culture or natural cC affinity purification of PRO from recombinant cell culture or natural cC affinity purification of PRO from recombinant cell culture or natural cC protein associated primer. invention describes an isolated secereted reted and transmembrane pRO213, PRO700

                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                           Ś
                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity crown amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins comprising a PRO sector and producing PRO nucleic acid, a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO control PRO proteins or profused boys and producing PRO, a chimaeric molecule comprising pRO fused to a heterologous amino acid sequence, and an anti-PRO control PRO proteins or profused in a sample suspected of containing PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337 polypeptide, and PRO1559 polypeptide is useful for detecting PRO337 polypeptide, and PRO1559 polypeptide is useful for detecting PRO725, PRO7100 or PRO739. PRO4993 polypeptide is useful for linking a profuse is the toxin, radiolabel, or an antibody. The bioactive molecule to a cell expressing PRO337 polypeptide for linking a profuse is the toxin, radiolabel, or an antibody. The bioactive molecule causes death of the cell. PRO337 polypeptide is useful for linking a causes death of the cell. PRO337 polypeptide is useful for linking a causes death of the cell. PRO337 polypeptide is useful for linking a causes death of the cell. PRO337 polypeptide is useful for linking a causes death of the cell. PRO337 polypeptide is useful for linking a causes death of the cell. PRO337 polypeptide is useful for linking a causes death of the cell. PRO337 polypeptide is useful for linking a causes death of the cell. PRO337 polypeptide is useful for linking a causes death of the cell.
                                                                                                                                                                                                                                                                    Query Match

Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide is useful for detecting PRO3559 polypeptide. Similarly, PRO4939 polypeptide is useful for detecting PRO3559 polypeptide, and PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO3559 polypeptide, and PRO1559 polypeptide is useful for detecting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide) a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide is useful for detecting a PRO4993 polypeptide.

PRO polypeptide such as PRO213, PRO700, PRO320 or PRO615 is useful in biotechnological and medical research, as well as in various industrial applications. PRO polypeptide such as PRO300, PRO866, PRO703, PRO708, PRO320, PRO351, PRO352, PRO381, PRO615, PRO618, PRO772, PRO853, PRO708, Or PRO866 is useful for therapeutic purposes. PRO363 is useful therapeutically in vivo for lessening the effects of viral infection. PRO200 is useful for treatment of wound healing, tissue growth and muscle generation and regeneration. PRO337 is useful for treating amyotrophic lateral sclerosis, neuropathy, AIDS-associated neuropathy or
                                                                                                                                                                                    Human; 88; PCR; secreted protein; transmembrane protein; PRO; cytostati ophthalmological; antiarthritic; ostcopathic; antirheumatic; vulnerary; auditory; tumour growth; retinal disorder; sporte-related joint problem articular cartilage defects; ostcoarthritis; rheumatoid arthritis; wound healing; hearing loss; primer; in situ hybridisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated secreted and transmembrane PRO polypeptides, useful preparation of a medicament for treating a condition responsive to polypeptide, and as therapeutic agents e.g. vaccines.

Also included are nucleic acids encoding the PRO proteins comprising the vector comprising a PRO nucleic acids), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising the vector and producing PRO, a chimaeric molecule comprising producing PRO, a chimaeric molecule comprising comprising the vector and producing PRO, a chimaeric molecule comprising comprising the vector and producing PRO, a chimaeric molecule comprising comprising producing PRO, a chimaeric molecule comprising producing PRO, a chimaeric molecule comprising comprising producing PRO, and producing PRO, produced is useful for detecting PRO, produced in the toxin, radiolabel, or an antibody. The bioactive molecule to a cell expressing PRO, poptide is useful for linking a bioactive molecule to a cell expressing PRO, poptide is useful for linking a bioactive molecule to a cell expressing PRO, poptide is useful for linking a bioactive molecule to a cell expressing PRO, poptide is useful for linking a bioactive molecule to a cell expressing PRO, poptide is useful for linking a bioactive molecule to a cell expressing PRO, poptide is useful for linking a bioactive molecule to a cell expressing PRO, poptide is useful for linking a bioactive molecule to a cell expressing PRO, poptide is useful for modulating the cell expressing PRO, poptide is useful for modulating the cell expressing PRO, poptide is useful for modulating the polypeptide is useful for modulating the biological activity of the cell expressing PRO, polypeptide is useful for modulating the biological activity of the cell expressing PR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S

                                                                                                                 The invention relates to an isolated PRO polypeptide (secreted or curansmembrane protein) having at least 80% amino acid sequence identity con amino acid sequence chosen from 94 fully defined sequence as given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins comprising the vector comprising a PRO nucleic acids encoding the PRO proteins antibody. PRO337 polypeptide is useful for detecting a PRO4939 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide, and PRO1559 polypeptide is useful for detecting PRO337 polypeptide, and PRO1559 polypeptide is useful for detecting PRO337 polypeptide, and PRO359 polypeptide is useful for detecting PRO359 polypeptide, and PRO359 polypeptide is useful for detecting PRO337 polypeptide, and PRO359 polypeptide is useful for detecting PRO359 polypeptide, and PRO359 polypeptide is useful for inking a bloactive molecule to a cell expressing PRO337 polypeptide is useful for inking a bloactive molecule to a cell expressing PRO337 polypeptide. PRO735, PRO700 or PRO739 polypeptide propeptide is useful for inking a company of the cell expressing PRO359 polypeptide is useful for inking a prospective molecule to a cell expressing PRO359 polypeptide is useful for inking a cell expressing PRO359 polypeptide is useful for inking a prospectide is useful for inking a polypeptide is useful for modulating the propertide is

CC to an amino acid sequence chosen from 94 fully defined sequences as given cc in the specification (including PRO lacking its associated signal CC peptide). Also included are nucleic acids encoding the PRO proteins CC mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO CC antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide. CC Similarly, PRO493 polypeptide is useful for detecting PRO337 CC polypeptide. PRO725, PRO700 or PRO735 polypeptide is useful for detecting PRO337 CC PRO7155 polypeptide, and PRO155 polypeptide is useful for detecting PRO357 CC polypeptide, and PRO155 polypeptide is useful for detecting PRO725, PRO700 or PRO739. PRO493 polypeptide is useful for inking a collecule to a cell expressing PRO337 polypeptide. The bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule concative molecule to a cell expressing PRO337 polypeptide. The bioactive molecule concative molecule to a cell expressing PRO337 polypeptide. The bioactive molecule concative molecule to a cell expressing PRO493 polypeptide; PRO725, CC pRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide is useful for PRO725, CC pro700 or PRO739 polypeptide are useful for a cell expressing PRO725, CC pro700 or PRO739 polypeptide. PRO493 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide is useful for mati-PRO337 CC pro700 or PRO739 polypeptide. PRO4933 polypeptide is cell expressing PRO337 cc pro700 or PRO739 polypeptide. PRO337 polypeptide is cell expressing PRO725, CC pro700 or PRO739 polypeptide. PRO337 polypeptide is cell expressing PRO337 cc pro700 or PRO739 polypeptide. PRO337 polypeptide is cell expressing PRO337 cc pro703 polypeptide. PRO337 polypeptide is cell expressing PRO337 cc pro703 polypeptide. PRO337 cc pro703 polypeptide. PRO3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     22-MAY-1998;

                               polypeptide or anti-PRO4993 polypeptide is useful for modulating the biological activity of the cell expressing PRO4993 polypeptide; PRO725, PRO700 or PRO739 polypeptide or an anti-PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO1559 polypeptide; and PRO1559 polypeptide or anti-PRO700 or anti-PRO709 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, PRO700 or PRO739 polypeptide. The polypeptide are useful for inhibiting tumour growth, retinal disorders, sports-related joint problems, articular cartilage defects, osteoarthritis or rheumatoid arthritis, wound healing and hearing loss in mammals. The present sequence is a Tagman PCR primer used investigate PRO gene amplification in certain tumour cell lines.

New secreted and transmembrane PRO nucleic acids and polypeptides, useful for stimulating the release of tumor necrosis factor alpha from human blood and stimulating the proliferation of differentiation of chondrocyte

Shelton

멅

Example 114; SEQ 日 ğ 577; 462pp; English

Ct transmembrane protein) having at least 80% amino acid sequence described or transmembrane protein) having at least 80% amino acid sequence as given CC in the specification (including PRO lacking its associated signal CC peptide). Also included are nucleic acids encoding the PRO proteins CC mentioned above, a vector comprising PRO, achimearic molecule comprising the vector and producing PRO, chimearic molecule comprising CC pRO fused to a heterologous amino acid sequence, and an anti-PRO CC antibody. PRO337 polypeptide is useful for detecting a PRO4933 CC polypeptide in a sample suspected of containing PRO4993 polypeptide. CC Similarly, PRO4993 polypeptide is useful for detecting a PRO4993 CC polypeptide. PRO700 or PRO739. PRO700 or PRO739 polypeptide is useful for detecting PRO337 CC polypeptide is not containing PRO4993 polypeptide. CC pRO705, PRO700 or PRO739. PRO4993 polypeptide is useful for detecting CC pRO705, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule to a cell expressing PRO4993 polypeptide. The bioactive molecule is the coll. PRO337 polypeptide; and PRO4993 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO725, CC PRO700 or PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO725, CC PRO700 or PRO739 polypeptide. PRO4993 polypeptide is useful for modulating the coll expressing PRO725, CC PRO700 or PRO739 polypeptide. PRO4993 polypeptide or anti-PRO37 polypeptide is useful for modulating the propeptide; where the cell is killed. PRO37 CC modulating the biological activity of the cell expressing PRO725, PRO725, PRO725, CC PRO700 or PRO739 polypeptide or anti-PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO725, CC PRO700 or PRO739 polypeptide is useful for modulating the propeptide; and PRO1559 polypeptide propeptide. The cell expressing PRO725, PRO700 or PRO739 polypeptide is useful for modulat The invention relates als. The present sequence is a Tagman PCR pr amplification in certain tumour cell lines. to an isolated PRO polypeptide (secreted or) having at least 80% amino acid sequence identity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0
```

New genes, and its encoded secreted and transmembrane polypeptides, useful for treating e.g. lung or breast tumors, osteoarthritis, rheumatoid arthritis, obesity, diabetes, hyperinsulinemia, 2003-875640/81.

Example 114; SEQ ID NO 577; 459pp; English

hypoinsulinemia or wounds.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337

```
CC polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting CC PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a CC bloactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule to a cell expressing PRO337 polypeptide; PRO7055, CC pRO700 or PRO739 polypeptide are useful for linking a CC bloactive molecule to a cell expressing PRO339 polypeptide; PRO725, CC pRO700 or PRO739 polypeptide. PRO4993 polypeptide; PRO725, CC pRO700 or PRO739 polypeptide. PRO4993 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO375, CC pRO700 or PRO739 polypeptide. PRO4993 polypeptide or anti-PRO337 CC polypeptide is useful for modulating at least one biological activity of the cell expressing PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 CC polypeptide or anti-PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO735, CC pro700 or PRO739 polypeptide or anti-PRO493 polypeptide is useful for modulating the biological activity of the cell expressing PRO493 polypeptide; PRO735, CC pro700 or PRO739 polypeptide or anti-PRO795, anti-PRO735, polypeptide is useful for modulating the biological activity of the cell expressing PRO493 polypeptide; and PRO4559 polypeptide is useful for modulating the biological activity of the cell expressing PRO755, anti-PRO700 or anti-PRO739 polypeptide; and PRO4559 polypeptide is useful for modulating the biological activity of the cell expressing PRO755, anti-PRO700 or anti-PRO739 polypeptide; and PRO4559 polypeptide or anti-PRO755, anti-PRO700 or anti-PRO739 polypeptide; anti-PRO755, anti-PRO739 polypeptide; and PRO4559 polypeptide; and profite or anti-PRO755, anti-PRO756, anti-PRO756, anti-PRO756, anti-PRO756, anti-PRO756, a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             RESULT 961
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              នន្តន្តន្តន្ត
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Local Similarity Matches 17; Conserv
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 rheumatoid arthritis in which synovial fluid, joint tissue or peripher blood is analysed to detect greater than normal expression of WNT10B. method is useful for simple diagnosis of rheumatoid arthritis and its discrimination from osteoarthritis. The present sequence represents a primer used in the invention.
                                                                                            The present invention describes a method for detecting wheat and barley fungal pathogens which are resistant to certain fungicides. The wheat and barley fungi are Tapesia yallundae and Tapesia acuformis, which cause eyespot disease. The present invention describes nucleic acid molecules, a kit and a method which are useful for detecting the fungal pathogen, and can be used for monitoring disease development in plant populations. The present sequence is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecules useful for detecting a fungal pathogen, for monitoring disease development in plant populations and for deriving primers for polymerase chain reaction-based diagnostic assays.
                                                                                                                                                                                                                                                                                                                                                                 Claim 3; SEQ ID NO 66; 41pp; English.

                                                                                                                                                                                                                                                                                   hybridisation. The oligonucleotides have a sequence complementary to the sequence of at least two portions of the nucleic acid. Hybridisation of the oligonucleotides on the nanoparticles with the nucleic acid results in a detectable change. This sequence represents a linking oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of detecting a nucleic acid with at least two portions by providing a type of nanoparticle-oligonucleotide conjugate, contacting the nucleic acid and nanoparticles to allow hybridisation of the oligonucleotides with the two or more portions of the nucleic acid and observing a detectable change brought about by the nucleic acid and observing a detectable change brought about by
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detection of nucleic acid having at least two portions comprises contacting the nucleic acid and nanoparticles under conditions to allow hybridization of the oligonucleotides, and observing detectable change brought by hybridization.

                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of detecting a nucleic acid with at least two portions by providing a type of nanoparticle-oligonucleotide conjugate, contacting the nucleic acid and nanoparticles to allow hybridisation of the oligonucleotides with the two or more portions of the nucleic acid and observing a detectable change brought about by hybridisation. The oligonucleotides have, a sequence complementary to the sequence of at least two portions of the nucleic acid. Hybridisation of the oligonucleotides on the nanoparticles with the nucleic acid results in a detectable change. This sequence represents a linking oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting nucleic acid having two portions, by providing nanoparticles having oligonucleotides attached to it, contacting nucleic acid and nanoparticles to allow hybridization, and observing detectable change.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to methods of detecting nucleic acids whether natural or synthetic and whether modified or unmodified. The invention also relates to materials for detecting nucleic acids and to methods of separating a selected nucleic acid from other nucleic acids. The invention is useful for detecting nucleic acid having at least2 portions. The present sequence is an oligonucleotide used to synthesise and purify fluorescein labelled oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection of nucleic acid with two portions comprises providing nanoparticles having oligonucleotides, contacting nucleic acid annoparticles to allow hybridization of oligonucleotides on nanoparticles, and observing detectable change.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mirkin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Taton
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     09-APR-2003;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US2003180783-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a method of preventing or treating tumour metastasis in an animal comprising administering to the animal an oligonucleotide 8-50 nucleotides in length, which is targeted to mRNA encoding human raf and capable of inhibiting raf expression. Also disclosed are raf oligonucleotides, nucleic acids, proteins and compositions used in the methods of the invention. The oligonucleotides have cytostatic and antiarteriosclerotic proporties, are useful as Rafinhibitors and in antisense-therapy. The methods and compositions of the present invention are useful for preventing and/or treating conditions associated with raf expression, such as hyperproliferative disorders, atherosclerosis and tumours. This sequence represents a human b-raf
Detection of nucleic acid useful for, e.g. research and analytical laboratories in deoxyribonucleic acid sequencing, comprises contact nucleic acid with at least two types of nanoparticles attached with oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   29-JUL-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a method of detecting a nucleic acid with at least two portions by providing a type of nanoparticle-oligonucleotide conjugate, contacting the nucleic acid and nanoparticles to allow hybridisation of the oligonucleotides with the two or more portions of the nucleic acid and observing a detectable change brought about by hybridisation. The oligonucleotides have a sequence complementary to the sequence of at least two portions of the nucleic acid. Hybridisation of the nanoparticles with the nucleic acid results in a detectable change. This sequence represents a linking
                                                                                                                                   The invention relates to a novel method for identifying a wheat variety having the Wx-Die (waxy) gene comprising detecting the presence or absence of the amylose synthetase (Wx-Die gene). The method of the invention may be useful for efficiently identifying a wheat variety having the Wx-Die gene. The current sequence is that of the bread wheat
                                                                                                 Sequence
                                                                                                                                                                                                              Claim 11; SEQ ID NO 18; 38pp; Japanese.

The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for disease and determination of side effect to a medical agent. The isolated human gene is also useful for polymorphisms in a human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism.
                                                              Single nucleotide polymorphism detection primer, SEQ ID No 1791.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 20 BP; 4 A; 8 C; 4 G; 4 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel polymucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide
human; single nucleotide polymorphism; microarray; side effect; ss;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphisms in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 20 BP; 5 A; 2 C; 9 G; 4 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO37 polypeptide is useful for detecting a PRO493 polypeptide. PRO739 polypeptide is useful for detecting producing PRO493 polypeptide. Similarly, PRO493 polypeptide is useful for detecting produced. Similarly, PRO493 polypeptide, and PRO1559 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO725, PRO700 or PRO739.
                                                                                                                                                                                                                                                                                                                                                                                    US2003206915-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                11-MAR-2004

New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy for treating obesity or diabetes, in chromosome and gene mapping, and as chromosome markers in tissue typing.

Example 114; SEQ ID NO 577; 520pp; English.

Competide). Also included are nucleic acids encoding the PRO proteins comprised. Also included are nucleic acids encoding the PRO proteins comprisely the vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising CC pRO fused to a heterologous amino acid sequence, and an anti-PRO cantibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide is useful for detecting a PRO493 polypeptide. CC Similarly, PRO493 polypeptide is useful for detecting PRO493 polypeptide. CC polypeptide, PRO710 or PRO739, PRO700 or PRO739 polypeptide is useful for detecting PRO337 CC polypeptide, and PRO1559 polypeptide is useful for detecting PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for detecting CC PRO725, PRO700 or PRO739, PRO4993 polypeptide is useful for inking a CC ploactive molecule to a cell expressing PRO337 polypeptide is useful for inking a CC pro700 or PRO739 polypeptide are useful for inking a CC pro700 or PRO739 polypeptide are useful for inking a bloactive molecule to a cell expressing PRO1559 polypeptide, and PRO1559 polypeptide is useful for inking a bloactive molecule concell expressing PRO337 polypeptide or anti-PRO337 polypeptide, where the cell is killed. PRO337 polypeptide, where the cell is killed. PRO337 polypeptide or anti-PRO337 polypeptide, where the cell is killed. PRO337 polypeptide or anti-PRO339 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 polypeptide. PRO337 polypeptide or anti-PRO337 polypeptide. PRO337 polypeptide or anti-PRO337 polypeptide or anti-PRO337 polypeptide. PRO337 polypeptide or anti-PRO337 polypeptide. PRO337 polypeptide programation proposed programatic proposed programatic proposed programatic proposed programatic pr to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal The invention relates to an isolated PRO polypeptide (secreted protein) having at least 80% amino acid sequence given

Non-nucleotide probe of the invention #12.

```
CC cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The probe is also useful in comparing a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid reference array. CC The method comprises treating a sample of genomic nucleic acid and cc control genomic nucleic acid, which are differentially labelled, the carray or both the sample and control genomic nucleic acid and the array or high the mixture of the probe under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic contacting the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the cample as compared with the relative copy numbers of substantially correct as determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid hybridization of the genomic nucleic acid to be tested and the reference of the genomic array is determined by determining the presence, absence, amount or location of the detectable moiety such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable label on the one or more genomic correctors. The present sequence from the correct security and the reference of correctors. The present sequence from the correct security and the probability of the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                from genomic nucleic acid, to one or more undesired sequences in an assay for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or more detectable nucleic acid probes to the target genomic nucleic acid of the sample. The genomic nucleic acid is contained in a fixed tissue or a the sample. The genomic nucleic acid is contained in a fixed tissue or a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a non-nucleotide probe. The probe is useful for suppressing the binding of one or more detectable nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 10; SEQ ID NO 14; 103pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hyldig-Nielsen JJ, Williams
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          probe of the invention #24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   BF;
```

Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic

Claim 10; SEQ ID NO 26; 103pp; English.

cc cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The crown of a control sample using a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid reference array. The control genomic nucleic acid and the array with the sample and control genomic nucleic acid and the array with treated mixture of sample and control genomic contacting the array with treated mixture of sample and comparing the contacting the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the control sample as compared with the relative copy numbers of substantially cor its fragment, that is specific for a nucleic acid, nucleic acid hybridization or intercalating dye or a detectable antibody, cor its fragment, that is specific for a nucleic acid are labelled with detectable moders of that hybridization of the probes to genomic acid are labelled with detectable moders of substantially and intercalating dye or a detectable acid hybridization acid are labelled with detectable moders of substantially and the reference of the sample of genomic nucleic acid hybridization of the probes to genomic acid are labelled with detectable moders of substantially and intercalating dye or a detectable acid hybridization and the acid and the reference of the sample of genomic nucleic acid hybridization acid. comprises contacting the sample with the one or more comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or more detectable nucleic acid probes to the target genomic nucleic acid of the sample. The genomic nucleic acid is contained in a fixed tissue or a the sample. The genomic nucleic acid is contained in a fixed tissue or a contained in a c useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprises contacting the sample with the mixture of probes) of the genomic array is determined by determining the amount or location of the detectable label on the one The present sequence represents a non-nucleotide probe. The probe is presence, absence, or more genomic is prepared from

WPI; 2003-765401/72.

New isolated PRO polypeptide e.g. PRO200, PRO322, PRO540, PRO846 or PRO617 polypeptide, useful for treating sight loss due to retinitis pigmentosum by enhancing retinal neural cells survival.

Example 114; SEQ ID NO 577; 465pp; English.

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO493 polypeptide.

CC first active agent comprising an oligonucleatide antisense to the contribution codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, 5' or 3' end genomic flanking regions, CC junctions of genes encoding a polypeptide associated with lung and/or comparisons of genes encoding a polypeptide associated with lung and/or comparisons are triinflammatory steroid and ubiquinone. A composition of the invention cc antiinflammatory, antiallergic, antiasthmatic, hypotensive, cc immunosuppressive, and cytostatic activity. The composition may have a cc material are gene therapy. The composition is useful for treating or correventing a respiratory, lung or malignant disease or condition, also correducing sensitivity to adenosine, reducing or depleting levels of of, or reducing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing bronchoconstriction, increasing bronchocons lung inflammation, lung allergies, or a respiratory disease or condition Note: The sequence data for this patent is not represented in the printer specification, but was obtained in electronic format directly from WIPO specification, The invention relates to a novel pharmaceutical composition, ftp.wipo.int/pub/published_pct_sequences which has the printed ဓ္ ø

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                    junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine of reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or
                                                  lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                       The invention relates to a novel pharmaceutical composition, which has first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5 or 3 end genomic flanking regions, 5 and 3 intron-exon junctions, or regions within 2-10 nucleotides of
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       31-OCT-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human oligonucleotide sequence.

                                                                                                  The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC entiinflammatory steroid in a subject, for reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of biquinone or CC lung surfactant in a subject's tissue, or treating bronchoconstriction, CC lung inflammation, lung allergies, or a respiratory disease or condition. CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or at fermion in formation of the printed or t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                               The invention relates to a novel pharmaceutical composition, which has a clive agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an cantinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antisflammatory steroid in a subject, for reducing or deplating levels of, or reducing sensitivity to adenosine, reducing levels of ubiquinone or curfactant in a subject, a increasing levels of ubiquinone or constraint and subject or theraping levels of ubiquinone or constraint and subject or the safety of the prophylactic or therapeutic respiratory effect of an antischamatory steroid in a subject, for reducing levels of ubiquinone or creeptor, producing bronchodilation, increasing levels of ubiquinone or constraints.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nyce JW,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    , Matches
                                                                                                  The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisence to the CC initiation codon, codding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of Junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, have a CC immunosuppressive, and cytostatic activity. The composition may have a CC immunosuppressive, and cytostatic activity. The composition may have a CC for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of antiinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine or CC lung surfactant in a subject's tissue, or treating bronchoconstriction.

CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or feeting the printed of the printed of the printed or the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                            The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5 or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of CC junctions of genes encoding a polypeptide associated with lung and/or CC nasal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC immunosuppressive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an cantiinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of bulquinone or CC lung surfactant in a subject s tissue, or treating bronchocomstriction, lung sulfalamation, lung allergies, or a respiratory disease or condition, CC Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO or at fern wino intramble and accessed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                   The invention relates to a novel pharmaceutical composition, which has a CC first active agent comprising an oligonucleotide antisense to the CC initiation codon, coding region, 5' or 3' end genomic flanking regions, CC 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or CC massal airway dysfunction and a second active agent comprising an CC antiinflammatory steroid and ubiquinone. A composition of the invention CC has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a CC use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also CC for enhancing the prophylactic or therapeutic respiratory effect of an CC entiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of become or CC lung inflammation, lung allergies, or a respiratory disease or condition.
